## Reliability of Rates

Precautions should be taken in drawing specific inferences from comparisons of rates for different geographic areas or different periods of time. Rates based on a small number of events or for a small geographic area tend to exhibit considerable variation from time period to time period or place to place. Excessive variation in rates not only negates the utility as estimators of probability of an event occurring, but also their usefulness for comparative purposes.

In addition, the reader should recognize the limitations of using unadjusted rates in attempting to attribute rate differences to particular factors. For example, the reader should not attempt to state that there was a significant difference in rates for two geographic areas for diseases of the heart without first adjusting the rates to negate the effect of differing age distributions in the two areas ( age adjust). Many times there are simply not sufficient data available to adequately adjust rates for all possible compounding factors. For this reason, the reader should exercise diligence and caution while attempting to draw substantive conclusions when comparing vital statistics rates.

Care should be taken when comparing years with different ICD versions for coding causes of death. ICD-10 was implemented in 1999.

Rates for 1980 – 1985 were calculated using the 1980 census.

Rates for 1986 – 1999 were calculated using the 1990 census.

Rates for 2000 were calculated using the 2000 census estimates.
